

REMOTE ANNUNCIATOR SOFTWARE, KEY, & D-LAN OPTION

Requirements

- D-LAN Option, P/N 020001-0117 Included with purchase of the first Remote Annunciator
- SYSTEM 3505, sold separately
- Remote Annunciator operates on a computer with Windows XP or Windows CE, supplied by others

Features

- Custom Select Actions
- Easy access to Event History
- Independent, password protected Administrator and Operator functions
- Alarm priority filtering
- Data export functions
- Custom Sounds & Colors
- SST Transmitting (optional)
- SMS Text-2-Cell (optional)
- In/Out of Service

Product Description

DIGITIZE Remote Annunciator Software is used to provide multiple operator interfaces for one or more System 3505 Universal Receivers.

The Remote Annunciator features programmable color and sound schemes (.wav files) for events, historical data and data export functions. It operates on a Windows CE or XP platform. The Remote Annunciator Software links a PC to the System 3505 using a standard Ethernet connection, provided by others. Multiple Remote Annunciators equipped PCs may be networked to a System 3505 (or networked System 3505s) to provide specialized alarm monitoring by alarm priority, i.e., separate Remote Annunciators for fire, security, and/or maintenance. (Multiple RA units require the purchase of the Digitize D-LAN Option with Smart-IP Card, see cut-sheet 750561-0000.)

The Remote Annunciator allows personnel to monitor all System 3505 activity from more than one location. The Remote Annunciator allows key information to be displayed, instant access to key alarm data, filtering by alarm priority, and password protected control of access to system programming and data functions to prevent unauthorized changes and errors.

Operator & dispatcher benefits include: increased efficiency, notification in the event of signal interruption and the ability to export the alarm history log (in comma delimited files) to other programs (e.g., Excel or Word) for preparation of user-defined reports.

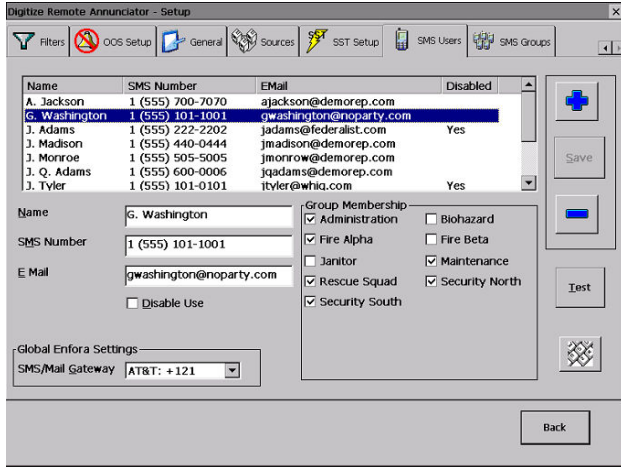

Optional Features

Digitize SMS Text-2-Cell: Small Message Service Text-2-Cell Option transmits System 3505 alarm data and user-defined text to pre-programmed groups of designated recipients for alarms, troubles, supervisory and other conditions (based on filter settings selected by user) via a cell phone network. Please see cut-sheet 750574-0001 for more details.

In/Out of Service

SST Relay Control

Test Mode

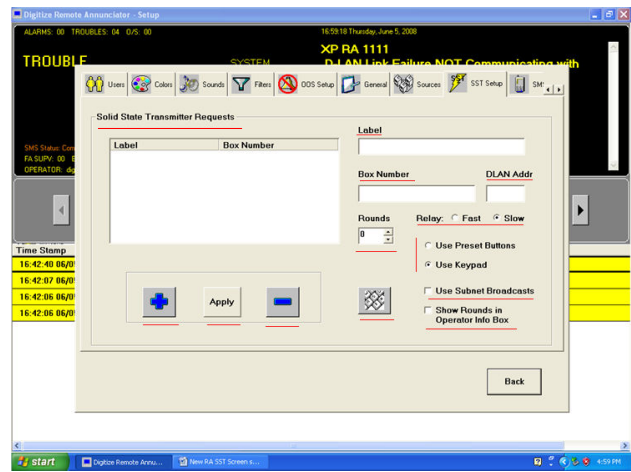

Setup for SMS Users- Add a New User

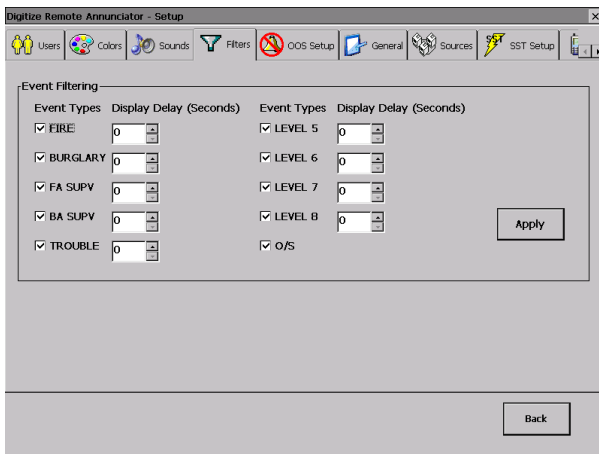

Setup for Sounds—Program Custom Sound Selections

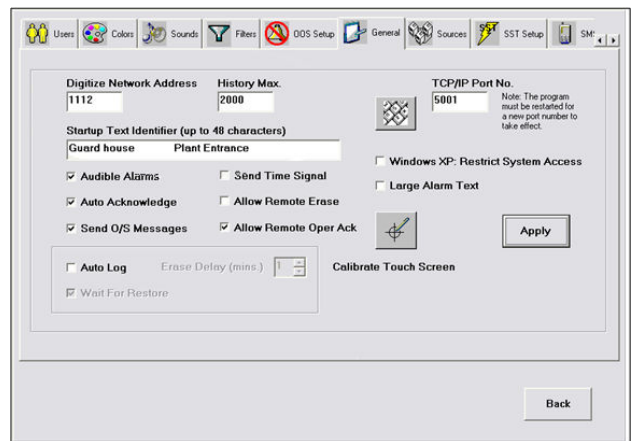

Place an Account into Out of Service (OSS)
